(Schrinner et al. 2007) expressed the induction equation in terms of the mean field (e.g. azimuthal average) such that  $\boldsymbol{B} = \overline{\boldsymbol{B}} + \boldsymbol{b}$  and  $\boldsymbol{U} = \overline{\boldsymbol{U}} + \boldsymbol{u}$ Taking the curl of (1)

$$\frac{\partial}{\partial t}(\overline{\boldsymbol{B}} + \boldsymbol{b}) = \nabla \times (\overline{\boldsymbol{U}} + \boldsymbol{u}) \times (\overline{\boldsymbol{B}} + \boldsymbol{b}) + \eta \nabla^2 (\overline{\boldsymbol{B}} + \boldsymbol{b}), \quad (6)$$

$$\frac{\partial \overline{\boldsymbol{B}}}{\partial t} = \nabla \times (\overline{\boldsymbol{U}} \times \overline{\boldsymbol{B}}) + \nabla \times \mathcal{E} + \eta \nabla^2 \overline{\boldsymbol{B}}, \tag{7}$$

where the electromotive force (EMF)  $\mathcal{E} = \overline{\boldsymbol{u} \times \boldsymbol{b}}$ 

(Schrinner et al. 2007) expressed the induction equation in terms of the mean field (e.g. azimuthal average) such that  $\boldsymbol{B} = \overline{\boldsymbol{B}} + \boldsymbol{b}$  and  $\boldsymbol{U} = \overline{\boldsymbol{U}} + \boldsymbol{u}$ Taking the curl of (1)

$$\frac{\partial}{\partial t}(\overline{\boldsymbol{B}} + \boldsymbol{b}) = \nabla \times (\overline{\boldsymbol{U}} + \boldsymbol{u}) \times (\overline{\boldsymbol{B}} + \boldsymbol{b}) + \eta \nabla^2 (\overline{\boldsymbol{B}} + \boldsymbol{b}), \quad (6)$$

$$\frac{\partial \overline{\boldsymbol{B}}}{\partial t} = \nabla \times (\overline{\boldsymbol{U}} \times \overline{\boldsymbol{B}}) + \nabla \times \mathcal{E} + \eta \nabla^2 \overline{\boldsymbol{B}}, \tag{7}$$

where the electromotive force (EMF)  $\mathcal{E} = \overline{\boldsymbol{u} \times \boldsymbol{b}}$ 

$$\frac{\partial \boldsymbol{b}}{\partial t} = \nabla \times (\overline{\boldsymbol{U}} \times \boldsymbol{b}) + \nabla \times (\boldsymbol{u} \times \overline{\boldsymbol{B}}) + \nabla \times \boldsymbol{G} + \eta \nabla^2 \boldsymbol{b}, \quad (8)$$

where  $\boldsymbol{G} = \boldsymbol{u} \times \boldsymbol{b} - \overline{\boldsymbol{u} \times \boldsymbol{b}}$ 

### $\mathcal{E}$ is a functional of $\boldsymbol{u}$ , $\overline{\boldsymbol{U}}$ and $\overline{\boldsymbol{B}}$ , i.e. linear in $\overline{\boldsymbol{B}}$ Let us assume that $\boldsymbol{b}$ vanishes for $\overline{\boldsymbol{B}} \to 0$

・ロト ・ 同 ・ ・ ヨ ・ ・ ヨ ・ ・ つ へ つ ・

 $\mathcal{E}$  is a functional of  $\boldsymbol{u}$ ,  $\overline{\boldsymbol{U}}$  and  $\overline{\boldsymbol{B}}$ , i.e. linear in  $\overline{\boldsymbol{B}}$ Let us assume that  $\boldsymbol{b}$  vanishes for  $\overline{\boldsymbol{B}} \to 0$ 

Further assume only weakly in space and time In general, if no higher than first order spatial derivatives and no time derivatives of  $\overline{B}$  are taken into account then in general

 $\mathcal{E} = \mathbf{a}\overline{\mathbf{B}} + \mathbf{b}\nabla\overline{\mathbf{B}}$ 

with second rank **a** and third rank **b** tensors i.e. 36 independent coefficients

#### in curvelinear coordinates can be expressed

$$\mathcal{E} = \alpha \overline{\mathbf{B}} + \gamma \times \overline{\mathbf{B}} - \beta \cdot (\nabla \times \overline{\mathbf{B}}) - \delta \times (\nabla \times \overline{\mathbf{B}}) - \kappa \cdot (\nabla \overline{\mathbf{B}})^{\text{sym}}$$
(9)

<ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 0 < 0

in curvelinear coordinates can be expressed

$$\mathcal{E} = \alpha \overline{\mathbf{B}} + \gamma \times \overline{\mathbf{B}} - \beta \cdot (\nabla \times \overline{\mathbf{B}}) - \delta \times (\nabla \times \overline{\mathbf{B}}) - \kappa \cdot (\nabla \overline{\mathbf{B}})^{\text{sym}}$$
(9)

Coefficients, vectors  $\gamma$  and  $\delta$ , second rank tensors  $\alpha$  and  $\beta$ , and third rank tensor  $\kappa$  represent a decomposiiton of the velocity field and can be related to physical processes, helping us to understand the structure of the dynamo.

Assuming axisymmetry in spherical geometry, then reduce to 27 independent coefficients

・ロ・・ 日・・ 日・・ 日・ うらつ

in curvelinear coordinates can be expressed

$$\mathcal{E} = \alpha \overline{\mathbf{B}} + \gamma \times \overline{\mathbf{B}} - \beta \cdot (\nabla \times \overline{\mathbf{B}}) - \delta \times (\nabla \times \overline{\mathbf{B}}) - \kappa \cdot (\nabla \overline{\mathbf{B}})^{\text{sym}}$$
(9)

Coefficients, vectors  $\gamma$  and  $\delta$ , second rank tensors  $\alpha$  and  $\beta$ , and third rank tensor  $\kappa$  represent a decomposiiton of the velocity field and can be related to physical processes, helping us to understand the structure of the dynamo.

Assuming axisymmetry in spherical geometry, then reduce to 27 independent coefficients

How might we determine these coefficients?

Assume Eq.(8) for **b** pertains to a steady test field  $\overline{B}_T$ 

$$\frac{\partial \boldsymbol{b}}{\partial t} - \nabla \times (\overline{\boldsymbol{U}} \times \boldsymbol{b}) - \nabla \times \boldsymbol{G} - \eta \nabla^2 \boldsymbol{b} = \nabla \times (\boldsymbol{u} \times \overline{\boldsymbol{B}}_T) \quad (10)$$

・ロ・・ 日・・ 日・・ 日・ うらつ

Assume Eq.(8) for **b** pertains to a steady test field  $B_T$ 

$$\frac{\partial \boldsymbol{b}}{\partial t} - \nabla \times (\overline{\boldsymbol{U}} \times \boldsymbol{b}) - \nabla \times \boldsymbol{G} - \eta \nabla^2 \boldsymbol{b} = \nabla \times (\boldsymbol{u} \times \overline{\boldsymbol{B}}_{\mathcal{T}}) \quad (10)$$

For any given test field  $\overline{B}_T^{(i)}$  the EMF, depending only on  $\overline{U}$  and u, can be expressed

$$\mathcal{E}^{(i)} = \tilde{a}_{jk} \overline{\boldsymbol{B}}_{T_k}^{(i)} + \tilde{b}_{jkr} \frac{\partial \overline{\boldsymbol{B}}_{T_k}^{(i)}}{\partial r} + \tilde{b}_{jk\theta} \frac{1}{r} \frac{\partial \overline{\boldsymbol{B}}_{T_k}^{(i)}}{\partial \theta}$$
(11)

Applying these to 9 linearly independent axisymmetric test fields we can solve simultaneously for the 27 independent coefficients

・ロ・・ 日・・ 日・・ 日・ うらつ

Assume Eq.(8) for **b** pertains to a steady test field  $\overline{B}_T$ 

$$\frac{\partial \boldsymbol{b}}{\partial t} - \nabla \times (\overline{\boldsymbol{U}} \times \boldsymbol{b}) - \nabla \times \boldsymbol{G} - \eta \nabla^2 \boldsymbol{b} = \nabla \times (\boldsymbol{u} \times \overline{\boldsymbol{B}}_{\mathcal{T}}) \quad (10)$$

$$\mathcal{E}^{(i)} = \tilde{a}_{jk}\overline{\boldsymbol{B}}_{T_k}^{(i)} + \tilde{b}_{jkr}\frac{\partial\overline{\boldsymbol{B}}_{T_k}^{(i)}}{\partial r} + \tilde{b}_{jk\theta}\frac{1}{r}\frac{\partial\overline{\boldsymbol{B}}_{T_k}^{(i)}}{\partial \theta}$$
(11)

Applying these to 9 linearly independent axisymmetric test fields we can solve simultaneously for the 27 independent coefficients

How plausible is the mean field model?

So, assuming we have the coefficients and can analyse what role the various processes play in the dynamo.

Is it meaningful?

So, assuming we have the coefficients and can analyse what role the various processes play in the dynamo.

Is it meaningful?

It depends on the extent to which the EMF satisfies the assumptions

・ロ・・ 日・・ 日・・ 日・ うらつ

So, assuming we have the coefficients and can analyse what role the various processes play in the dynamo.

Is it meaningful?

It depends on the extent to which the EMF satisfies the assumptions

How does the mean field dynamo compare with the full solution?
